Title Innovative Trend Analysis and Time-Series Change Point Analysis

Version 1.2

Maintainer Sandeep Kumar Patakamuri <sandeep.patakamuri@gmail.com>

Description Innovative Trend Analysis is a graphical method to examine the trends in time series data. Sequential Mann-Kendall test uses the intersection of prograde and retrograde series to indicate the possible change point in time series data. Distribution free cumulative sum charts indicate location and significance of the change point in time series.

--------------	----------

df	<i>Example Data Frame for Innovative Polygon Trend Analysis</i>
----	---

Description

User is advised to prepare the data as suggested in the example to work with monthly data analysis using Innovative Polygon Trend Analysis Method.

Usage

df

Format

Data frame With Months in the first column, calculations from the first half values in the second column and calculations from the second half values in the third column.

dfcusum	<i>Distribution Free CUSUM Test</i>
---------	-------------------------------------

Description

Distribution free CUSUM test is used to identify the change point in a series of data.

Usage

dfcusum(x, startyear)

Arguments

x - Time series data vector
startyear - Starting of the time series (year!)

Details

The point at which Maximum value of cumulative sum occurs, will indicate the change point in the time series. If the maximum value is equal to or greater than the critical value, it indicates significance of the change point.

Value

CUMSUM values - Cumulative sum series

Maximum CUMSUM Value - Absolute Maximum value in cumulative sum series

90 percent CI - Critical value at 90 percent Confidence Interval ($1.228 \cdot \sqrt{n}$)

95 percent CI - Critical value at 95 percent Confidence Interval ($1.36 \cdot \sqrt{n}$)

99 percent CI - Critical value at 99 percent Confidence Interval ($1.63 \cdot \sqrt{n}$)

Examples

```
x<-c(Nile)
dfcusum(x,1871)
```

innovtrend

Innovative Trend Analysis

Description

Innovative trend analysis method proposed by Zekai Sen (2011) is implemented in this function.

Usage

```
innovtrend(x,ci = 95)
```

Arguments

x	- Time series data vector
ci	- Confidence Interval

Details

If the data points lay on 1:1 line, there is no trend in the data. If the data points exist in the top triangle, it is indicative of positive trend. If the data lies in the bottom triangle, it indicates negative trend in the data.

Value

S - Slope of the trend
 ssd - Slope Standard deviation
 correl - Correlation
 D - Trend indicator
 CLlower90 - Lower Confidence Limit at 90 percent
 CLupper90 - Upper Confidence Limit at 90 percent
 CLlower95 - Lower Confidence Limit at 95 percent
 CLupper95 - Upper Confidence Limit at 95 percent
 CLlower99 - Lower Confidence Limit at 99 percent
 CLupper99 - Upper Confidence Limit at 99 percent

Examples

```
x<-c(Nile)
innovtrend(x,ci= 95)
```

ipta

Innovative Polygon Trend Analysis

Description

Innovative Polygon Trend Analysis method proposed by Sen et al. (2019) is implemented in this function. This function is implemented to work with monthly time series. Users are advised to prepare input data frame as provided in example.

Usage

```
ipta(x = x, y = y, Monthly = Monthly)
```

Arguments

x	- First half of Time series data vector
y	- First half of Time series data vector
Monthly	- Months of Time series data vector

Value

Slope - Slope of the trend
Distance - Trend indicator

Examples

```
ipta(x = df$First_half, y = df$Second_half, Monthly = df$Months)
```

`sqmk`*Sequential Mann-Kendall Plot*

Description

The series is rearranged based on the ranks of the original series. Prograde and retrograde series plots are generated as per Sneyers (1990). The point where prograde and retrograde series intersect will approximately indicate the possible point of change.

Usage

```
sqmk(x, startyear)
```

Arguments

<code>x</code>	- Time series data vector
<code>startyear</code>	- Starting of the time series (year!)

Details

The point where prograde series and retrograde series intersect, will indicate probable change point in the series. When there is no clear trend in the data, the series will intersect at several locations.

Value

Prograde - Prograde series

Retrograde - Retrograde series

Intersection - True if intersecting and False if not intersecting.

x<-c(Nile)
sqmk(x, 1871)
```

x

Annual flow of the Nile River

Description

Nile River data available with R base is used for testing purpose

Usage

x

Format

Nile river flow measured at Aswan station during 100 year period from 1871 to 1970 is used for testing
